

KINGA AutoVerify AI — Claims Manager Portal Reconciliation Audit v2.0

Document Type: Second-Pass Reconciliation Audit
Portal: Claims Manager Portal
Audit Framework: KINGA Claims Manager Reconciliation Audit Prompt v2.0 (10-Phase, 10 Deliverables)
Date: June 2026
Preceding Document: KINGA Claims Manager Portal Audit v1.0
Status: Claims Operations Command Centre Assessment

Executive Summary

This document is a second-pass reconciliation audit of the KINGA Claims Manager Portal. It does not repeat the original audit. Its purpose is to validate the original findings against the current codebase, challenge assumptions that were made without full operational context, reassess priorities from a claims operations perspective, and produce a revised roadmap for evolving the portal into a Claims Operations Command Centre.

The reconciliation confirms that the most consequential finding of the original audit — the `sendBackClaim` defect — has been resolved. A dedicated `sendBackClaim` procedure now exists in `server/routers.ts` at line 3206, using the `WorkflowEngine` to perform the correct state transitions (`technical_approval` → `internal_review` and `financial_decision` → `technical_approval`) with mandatory comments and full audit trail recording. The frontend has been updated to call `trpc.claims.sendBackClaim` directly.

The reconciliation also identifies a significant intelligence gap that was underweighted in the original audit: the Claims Manager Dashboard makes **zero calls** to the analytics router. The Executive Dashboard calls eight analytics procedures (`getKPIs` , `getAssessorPerformance` , `getPanelBeaterAnalytics` , `getCostSavingsTrends` , `getWorkflowBottlenecks` , `getFinancialOverview` , `getMonthComparison` , `getExecutiveAlerts`), all of which are directly relevant to claims operations management. The Claims Manager — who is operationally responsible for throughput, SLA compliance, workforce management, and financial leakage — has no access to any of this intelligence within their portal.

Revised Top 5 Recommendations:

- [High]** Add a Claims Operations Intelligence Bar above the tab structure, consuming `getClaimsAgeing` , `getWorkflowBottlenecks` , `getCriticalAlerts` , and `getFraudInvestigationFunnel` — all of which already exist in the analytics router and are accessible to `claims_manager` role.
- [High]** Add a Workforce Intelligence panel to the Intake Queue tab, consuming `getAssessorPerformance` and `workflowAnalytics.getUserProductivity` — both procedures exist and return the data needed for assessor and processor workload management.
- [High]** Fix `closeForProcessing` — it currently calls `trpc.claims.approveClaim` with `selectedQuoteId: 0` , which creates an ambiguous audit record. A dedicated `closeForProcessing` procedure should record the closure intent explicitly.
- [High]** Add per-claim report buttons for `claim.cost_comparison` , `claim.repair_decision` , `claim.audit_trail` , and `claim.forensic` to the Review Queue tab — all four are authorised for `claims_manager` but have no UI entry point within the portal.
- [Medium]** Add Fleet Approvals to the sidebar navigation — the tab is fully functional but is not discoverable without prior knowledge.

Revised Production Readiness Verdict: Conditional — Operationally Viable with Intelligence Gaps. The critical `sendBackClaim` defect has been resolved. The portal can support supervised claims operations, but the absence of portfolio intelligence (ageing, bottlenecks, workforce, fraud funnel) means the Claims Manager is operating without the command centre visibility their role requires. This is not a blocker for go-live, but it is a significant operational deficiency that should be addressed in the first post-launch sprint.

Deliverable 1 — Validated Findings Register

Phase 1: Audit Validation

The following table reviews every material finding from the original audit and determines its current validity.

Finding	Original Severity	Valid	Partially Valid	Invalid	Revised Priority	Reason
<code>sendBackClaim</code> calls <code>approveClaim</code> (broken)	Critical	—	—	Invalid (Resolved)	Closed	<code>trpc.claims.sendBackClaim</code> procedure exists at <code>routers.ts:3206</code> . Frontend wired <code>ClaimsManagerDashboard.tsx:269</code> . Workflow transitions are correct.
<code>closeForProcessing</code> calls <code>approveClaim</code> with <code>selectedQuoteId: 0</code>	Critical	Valid	—	—	High	<code>ClaimsManagerDashboard.tsx:252</code> still define <code>closeForProcessing = trpc.claims.approveClaim.useMutation</code> . The audit trail records this as an approval act a closure.
Fleet Approvals tab not in sidebar	High	Valid	—	—	High	The Fleet Approvals tab is functional but abse sidebar navigation. Discoverability remains ar
Claims Ageing visibility absent	High	Valid	—	—	High	<code>analytics.getClaimsAgeing</code> exists and 4-bucket data (0–7, 8–14, 15–30, 30+ days) v count and value per bucket. Not consumed by <code>ClaimsManagerDashboard</code> .
Fraud Funnel visibility absent	High	Valid	—	—	High	<code>analytics.getFraudInvestigationFunnel</code> exists and returns a 5-stage funnel (All Claims: Flagged → High Risk → Under Investigation Repudiated) with prevented loss value. Not c by <code>ClaimsManagerDashboard</code> .
Report discoverability gap (8 of 10 reports not surfaced)	High	Valid	—	—	High	Confirmed: only <code>portfolio.claims_summary</code> (dashboard header) and <code>claim.assessment</code> (Review Queue) have UI buttons. 8 authorise have no entry point within the portal.
Workflow bottleneck identification absent	Medium	Valid	—	—	High	<code>analytics.getWorkflowBottlenecks</code> ex returns per-state count, average days in state maximum days in state from the <code>workflow_audit_trail</code> table. Not consum <code>ClaimsManagerDashboard</code> .
Recovery visibility absent	Medium	Partially Valid	—	—	Medium	<code>trpc.recovery.getKPIs</code> IS consumed by <code>ClaimsManagerDashboard</code> (line 167) and ren recovery summary bar (Open Cases, Demand Settled, Recovery Rate, Deadline Alerts). Orig finding overstated the gap. The remaining gap absence of ageing and recovery-eligible claim identification.
Notification gaps	Medium	Valid	—	—	Medium	No notification triggers exist for: recovery case creation, risk manager escalation, assessor assignment confirmation, SLA breach, or final threshold proximity.
Portfolio AI intelligence absent	Medium	Valid	—	—	High	<code>ClaimsManagerDashboard</code> makes zero calls to analytics router. The Executive Dashboard ca analytics procedures. The Claims Manager — operationally responsible for portfolio perform has no access to portfolio-level AI intelligence their portal.
Assessor performance not surfaced	Medium	Valid	—	—	High	<code>analytics.getAssessorPerformance</code> ex returns performance score, accuracy score, t assessments, and average completion time p

Finding	Original Severity	Valid	Partially Valid	Invalid	Revised Priority	Reason
						assessor. Not consumed by ClaimsManagerDashboard.
SLA compliance data absent	Medium	Valid	—	—	High	workflowAnalytics.getSLACompliance with configurable SLA targets per workflow st consumed by ClaimsManagerDashboard.
Processor workload data absent	Medium	Valid	—	—	High	workflowAnalytics.getUserProductivi exists and returns transition count and claims per user per role. Not consumed by ClaimsManagerDashboard.

Summary of Validation

Of the 13 findings reviewed, 1 has been resolved (`sendBackClaim`), 1 was partially overstated (recovery visibility), and 11 remain valid. Three findings that were rated Medium in the original audit have been upgraded to High in this reconciliation, based on the operational significance of the missing intelligence for a claims operations command centre.

Deliverable 2 — Operational Intelligence Gap Register

Phase 2: Operational Intelligence Assessment

The following matrix assesses whether the portal provides sufficient intelligence for a Claims Manager to answer the core operational questions of their role.

Throughput Intelligence

Capability	Available	Partial	Missing	Recommendation
How many claims are entering the system?	Yes — <code>getManagerOverview.kpis.totalClaims</code>	—	—	Already displayed in dashboard KPI cards
How many are being completed?	Yes — <code>getManagerOverview.kpis.completedClaims</code>	—	—	Already displayed in dashboard KPI cards
What is the backlog?	—	Partial — Intake Queue tab shows count	—	Add a backlog KPI card showing intake + active counts with trend vs. prior period
Intake trend (week-on-week)	—	—	Missing	<code>analytics.getMonthComparison</code> returns month-on-month data; a week-on-week intake trend is not available
Completion rate trend	—	Partial — single percentage shown	—	Add trend arrow (up/down vs. prior period) to completion rate KPI card

Workflow Intelligence

Capability	Available	Partial	Missing	Recommendation
Which workflow stages are slowing down?	—	—	Missing	<code>analytics.getWorkflowBottlenecks</code> returns per-state count and avg/max days. Not consumed by ClaimsManagerDashboard. Add a Workflow Bottleneck panel.
Which claims are ageing?	—	—	Missing	<code>analytics.getClaimsAgeing</code> returns 4-bucket ageing data. Not consumed by ClaimsManagerDashboard. Add a Claims Ageing panel.
Where are bottlenecks occurring?	—	—	Missing	<code>workflowAnalytics.getBottlenecks</code> returns bottleneck state with avg hours. Not consumed by ClaimsManagerDashboard.
Claims stuck in workflow (7+ days)	—	—	Missing	<code>analytics.getCriticalAlerts</code> returns <code>stuckClaims</code> (claims not updated in 7+ days). Not consumed by ClaimsManagerDashboard.
Claims awaiting approval	Partial — Review Queue tab shows list	—	—	Add count badge to Review Queue tab label
SLA compliance per stage	—	—	Missing	<code>workflowAnalytics.getSLACompliance</code> returns compliance % per workflow state. Not consumed.

Workforce Intelligence

Capability	Available	Partial	Missing	Recommendation
Which processors are overloaded?	—	—	Missing	<code>workflowAnalytics.getUserProductivity</code> returns claims handled per user. Not consumed by ClaimsManagerDashboard.
Which assessors are overloaded?	—	—	Missing	<code>analytics.getAssessorPerformance</code> returns total assessments and avg completion time per assessor. Not consumed by ClaimsManagerDashboard.
Which staff members require intervention?	—	—	Missing	No combined workload view exists. Requires surfacing <code>getUserProductivity</code> + <code>getAssessorPerformance</code> in a single Workforce panel.
Assessor accuracy scores	—	—	Missing	<code>analytics.getAssessorPerformance</code> returns <code>accuracyScore</code> per assessor. Not consumed by ClaimsManagerDashboard.
Assessor tier distribution	—	—	Missing	<code>analytics.getAssessorPerformance</code> returns <code>tier</code> per assessor. Not consumed.

Fraud Intelligence

Capability	Available	Partial	Missing	Recommendation
Which claims require investigation?	Partial — Fraud Alerts tab shows list	—	—	Already available. Add count badge to Fraud Alerts tab label.
Is fraud increasing or decreasing?	—	—	Missing	<code>analytics.getFraudInvestigationFunnel</code> returns funnel counts but no trend. Add trend indicator.
Are fraud investigations effective?	—	—	Missing	<code>analytics.getFraudInvestigationFunnel</code> returns <code>conversionRate</code> (flagged → repudiated %). Not consumed by ClaimsManagerDashboard.
Prevented loss value	—	—	Missing	<code>analytics.getFraudInvestigationFunnel</code> returns <code>preventedLoss</code> . Not consumed.
High fraud risk claims in approval queue	—	—	Missing	<code>analytics.getCriticalAlerts</code> returns <code>highFraudRisk</code> claims in active states. Not consumed.

Financial Intelligence

Capability	Available	Partial	Missing	Recommendation
Are approvals aligned with KINGA estimates?	Partial — per-claim comparison view	—	—	No portfolio-level variance metric. <code>analytics.getCostSavingsTrends</code> returns total savings but not variance distribution.
Is leakage increasing?	—	—	Missing	<code>analytics.getMonthComparison</code> returns month-on-month approved vs. estimated. Not consumed by ClaimsManagerDashboard.
Are recoveries being pursued?	Partial — recovery KPI bar exists	—	—	Recovery rate and case counts are shown. Ageing recoveries and recovery-eligible claims are not shown.
High-value claims pending approval	—	—	Missing	<code>analytics.getCriticalAlerts</code> returns <code>highValuePending</code> (>R10,000 in technical_approval or financial_decision). Not consumed.
Total savings identified (portfolio)	Yes — KPI card	—	—	Already displayed.

Repair Network Intelligence

Capability	Available	Partial	Missing	Recommendation
Which panel beaters perform best?	—	—	Missing	<code>analytics.getPanelBeaterAnalytics</code> returns performance ranking. Not consumed by ClaimsManagerDashboard.
Which panel beaters generate excessive variance?	—	—	Missing	<code>analytics.getPanelBeaterAnalytics</code> returns avg quote amount vs. KINGA estimate. Not consumed.
Which panel beaters create delays?	—	—	Missing	<code>analytics.getPanelBeaterAnalytics</code> returns avg repair time days. Not consumed.
Panel beater report	Authorised	—	—	<code>portfolio.panel_beater_performance</code> report is authorised for <code>claims_manager</code> but has no UI button in the portal.

Deliverable 3 — Dashboard Enhancement Blueprint

Phase 3: Claims Manager Dashboard Enhancement Review

The existing six-tab structure (Intake Queue, Review Queue, Active Claims, Fraud Alerts, Processed Claims, Fleet Approvals) is well-designed and should be preserved in full. The following intelligence panels should be added **above** the tab structure, forming a Claims Operations Intelligence Bar that gives the Claims Manager an immediate portfolio-level view before they drill into individual tabs.

Panel	Data Exists?	Backend Exists?	Effort	Operational Value
Claims Ageing — 4-bucket bar chart (0–7, 8–14, 15–30, 30+ days) with count and value	Yes — <code>analytics.getClaimsAgeing</code> returns 4 buckets with count and value	Yes — <code>analyticsRoleProcedure</code> accessible to <code>claims_manager</code>	Low (0.5 day)	Very High — immediate SLA breach visibility
Workflow Bottlenecks — per-stage count and avg days, sorted by avg days descending	Yes — <code>analytics.getWorkflowBottlenecks</code> returns per-state count, avg days, max days	Yes — <code>analyticsRoleProcedure</code> accessible to <code>claims_manager</code>	Low (0.5 day)	Very High — identifies where claims are accumulating
SLA Breaches — count of claims exceeding SLA target per stage	Yes — <code>workflowAnalytics.getSLACompliance</code> returns compliance % per stage	Yes — <code>protectedProcedure</code> accessible to all authenticated users	Medium (1 day)	High — direct SLA management tool
Team Workload — assessor performance ranking (performance score, accuracy, total assessments) + processor productivity (claims handled per user)	Yes — <code>analytics.getAssessorPerformance</code> + <code>workflowAnalytics.getUserProductivity</code>	Yes — both procedures exist	Medium (1 day)	High — workforce management visibility
Fraud Funnel — 5-stage funnel (All → Flagged → High Risk → Investigated → Repudiated) with conversion rate and prevented loss	Yes — <code>analytics.getFraudInvestigationFunnel</code> returns all 5 stages	Yes — <code>analyticsRoleProcedure</code> accessible to <code>claims_manager</code>	Low (0.5 day)	High — fraud oversight without leaving portal

Panel	Data Exists?	Backend Exists?	Effort	Operational Value
Recovery Overview — already partially implemented (recovery KPI bar at line 455)	Yes — <code>trpc.recovery.getKPIs</code> already consumed	Yes — already wired	Enhancement only (0.5 day)	Medium — add recovery-eligible claim count and ageing
Leakage Metrics — month-on-month approved vs. KINGA estimate, leakage rate	Yes — <code>analytics.getMonthComparison</code> returns month-on-month data	Yes — <code>analyticsRoleProcedure</code> accessible to <code>claims_manager</code>	Low (0.5 day)	High — financial leakage control
Escalation Alerts — high-value pending, high fraud risk in active states, disputed, stuck	Yes — <code>analytics.getCriticalAlerts</code> returns all 4 alert types	Yes — <code>analyticsRoleProcedure</code> accessible to <code>claims_manager</code>	Low (0.5 day)	Very High — immediate escalation visibility

Panel Implementation Notes

The Claims Operations Intelligence Bar should be rendered as a collapsible section above the tab structure, defaulting to expanded. It should not replace the tab structure — it should provide the portfolio view that allows the Claims Manager to decide which tab to navigate to. Each panel should include a direct action link to the relevant tab (e.g., the Claims Ageing panel should link to the Active Claims tab filtered by ageing bucket).

Deliverable 4 — Workflow Command Centre Assessment

Phase 4: Workflow Command Centre Assessment

A true workflow command centre requires the Claims Manager to be able to identify, at a glance, every category of claim that requires their attention. The following table assesses the current state.

Workflow Requirement	Currently Identifiable?	Data Source	Gap	Recommendation
Claims over SLA	No	<code>workflowAnalytics.getSLACompliance</code>	Not consumed by ClaimsManagerDashboard	Add SLA Breaches panel above tab structure
Claims requiring escalation	Partial — Fraud Alerts tab shows fraud-flagged claims	<code>analytics.getCriticalAlerts</code> returns high-value, high-fraud, disputed, stuck	<code>getCriticalAlerts</code> not consumed	Add Escalation Alerts panel above tab structure
Claims awaiting approval	Partial — Review Queue tab shows list	<code>workflowQueries.getClaimsByStatus</code>	No count badge on tab label; no summary count in overview	Add count badge to Review Queue tab label
Claims awaiting assessment	Partial — Active Claims tab shows list	<code>cclaims.getActiveClaims</code>	No filter for <code>under_assessment</code> state specifically	Add <code>under_assessment</code> count to Active Claims tab label
Claims awaiting repair	Partial — Active Claims tab shows list	<code>cclaims.getActiveClaims</code>	No filter for <code>repair_assigned</code> state	Add <code>repair_assigned</code> count to Active Claims tab label
Claims awaiting customer response	No	No dedicated procedure	No <code>awaiting_customer</code> workflow state exists	Not applicable — KINGA does not have a customer response workflow state
Claims stuck in workflow	No	<code>analytics.getCriticalAlerts</code> returns <code>stuckClaims</code> (7+ days without update)	Not consumed	Add stuck claims count to Escalation Alerts panel

Minimum Enhancements for Command Centre Functionality

The minimum set of enhancements required to make the Claims Manager Portal function as a true command centre are:

1. Add the Escalation Alerts panel (consuming `getCriticalAlerts`) — this provides immediate visibility of high-value pending, high fraud risk, disputed, and stuck claims in a single view.
2. Add the Claims Ageing panel (consuming `getClaimsAgeing`) — this provides SLA breach visibility at the portfolio level.
3. Add the Workflow Bottlenecks panel (consuming `getWorkflowBottlenecks`) — this identifies which stages are accumulating claims.
4. Add count badges to the Review Queue, Fraud Alerts, and Fleet Approvals tab labels — this provides at-a-glance queue depth without requiring tab navigation.

These four enhancements can be implemented in approximately 2 days of engineering effort and would transform the portal from a queue management tool into a genuine command centre.

Deliverable 5 — Workload Intelligence Assessment

Phase 5: Workload Intelligence Assessment

Processor Workload

Metric	Available?	Source	Gap
Claims assigned per processor	Partial	<code>workflowAnalytics.getUserProductivity</code> returns <code>claimsHandled</code> per <code>userId</code> where <code>userRole = 'claims_processor'</code>	Procedure exists but is not consumed by ClaimsManagerDashboard
Claims completed per processor	Partial	<code>workflowAnalytics.getUserProductivity</code> returns <code>transitionCount</code> (workflow transitions completed)	<code>transitionCount</code> is a proxy for productivity, not a direct “claims completed” count
Average cycle time per processor	No	No procedure	<code>workflowAnalytics.getProcessingTimesByStage</code> returns per-stage averages but not per-user averages

Assessor Workload

Metric	Available?	Source	Gap
Open assessments per assessor	No	<code>analytics.getAssessorPerformance</code> returns <code>totalAssessments</code> (lifetime total, not open)	No “currently open” count per assessor
Assessment turnaround	Yes	<code>analytics.getAssessorPerformance</code> returns <code>avgCompletionTime</code> (hours)	Available but not consumed by ClaimsManagerDashboard
Accuracy scores	Yes	<code>analytics.getAssessorPerformance</code> returns <code>accuracyScore</code>	Available but not consumed by ClaimsManagerDashboard
Performance tier	Yes	<code>analytics.getAssessorPerformance</code> returns <code>tier</code> (standard/senior/specialist)	Available but not consumed by ClaimsManagerDashboard

Team Capacity

Metric	Available?	Source	Gap
Open claims (portfolio total)	Yes	<code>getManagerOverview.kpis.totalClaims</code>	Already displayed in KPI cards
Available staff	No	No procedure	User availability is not tracked in the KINGA schema
Average workload per staff member	Partial	<code>workflowAnalytics.getUserProductivity</code> returns claims handled per user	Not consumed; no “current open” count per user

Workload Intelligence Recommendation

The most actionable enhancement for workload intelligence is a **Workforce Panel** in the Intake Queue tab (where assignment decisions are made). This panel should display:

- Assessor ranking by current workload (total assessments, accuracy score, avg completion time, tier)
- Processor productivity (claims handled in current period, transition count)

Both data sources exist. The panel would allow the Claims Manager to make informed assignment decisions rather than assigning blindly. The `analytics.getAssessorPerformance` procedure is already called by the Executive Dashboard — the Claims Manager simply needs access to the same data within their own portal.

Deliverable 6 — Recovery Oversight Assessment

Phase 6: Recovery Oversight Assessment

The original audit overstated the recovery visibility gap. The Claims Manager Dashboard already consumes `trpc.recovery.getKPIs` and renders a recovery summary bar showing: Open Cases, Demand Sent, Settled, Recovery Rate, and Deadline Alerts. This is a meaningful starting point.

The remaining gaps are:

Question	Currently Answerable?	Gap	Recommendation
How many claims are recovery eligible?	No	The recovery KPI bar shows open recovery cases but not the count of claims that are eligible for recovery but do not yet have a recovery case	Add a “Recovery Eligible” count to the recovery bar — claims that are <code>closed</code> with a third-party liability flag but no recovery case yet
What is the recovery value?	Partial — <code>recoveryKPIs.totalRecovered</code> is available via <code>getKPIs</code> but not displayed	The recovery bar shows rate and case counts but not the total quantum	Add total recovered amount and total settlement quantum to the recovery bar
What is the recovery success rate?	Yes — <code>recoveryKPIs.recoveryRate</code> is displayed	—	Already addressed
Which recoveries are ageing?	No	No ageing data in <code>getKPIs</code>	Add <code>approachingDeadlines</code> count (already returned by <code>getKPIs</code>) as a prominent alert in the recovery bar

The recovery bar should be enhanced rather than replaced. The recommended additions (recovery eligible count, total quantum, approaching deadlines alert) can be implemented without creating a separate Recovery Portal within the Claims Manager Dashboard. The existing `trpc.recovery.getKPIs` already returns `approachingDeadlines` and `totalRecovered` — these simply need to be surfaced in the UI.

Deliverable 7 — Report Accessibility Matrix

Phase 7: Report Accessibility Review

All 11 reports authorised for `claims_manager` are reviewed below. The recommended access point reflects where the report is most operationally useful, not just where it is technically accessible.

Report	Current Access	Recommended Access	Reason
<code>claim.assessment</code>	Review Queue tab (button exists)	Review Queue tab — keep as-is	Per-claim report; correct placement
<code>claim.cost_comparison</code>	Reports Centre only	Review Queue tab — add button alongside <code>claim.assessment</code>	Per-claim report; directly supports approval decision
<code>claim.repair_decision</code>	Reports Centre only	Review Queue tab — add button alongside <code>claim.assessment</code>	Per-claim report; directly supports repair authorisation decision
<code>claim.audit_trail</code>	Reports Centre only	Review Queue tab — add button alongside <code>claim.assessment</code>	Per-claim report; governance and compliance use
<code>claim.forensic</code>	Reports Centre only	Review Queue tab — add button alongside <code>claim.assessment</code>	Per-claim report; fraud investigation support
<code>portfolio.claims_summary</code>	Dashboard header (button exists)	Dashboard header — keep as-is	Portfolio report; correct placement
<code>portfolio.dwell_time</code>	Reports Centre only	Dashboard Actions — add to a “Portfolio Reports” dropdown in the dashboard header	Portfolio report; directly supports SLA management
<code>portfolio.panel_beater_performance</code>	Reports Centre only	Dashboard Actions — add to “Portfolio Reports” dropdown	Portfolio report; directly supports repair network management
<code>portfolio.fraud_summary</code>	Reports Centre only	Dashboard Actions — add to “Portfolio Reports” dropdown	Portfolio report; directly supports fraud oversight
<code>portfolio.assessor_performance</code>	Reports Centre only	Dashboard Actions — add to “Portfolio Reports” dropdown	Portfolio report; directly supports assessor management
<code>risk_manager_portfolio</code>	Reports Centre only	Reports Centre — keep	This report is a risk manager portfolio report; its presence in the <code>claims_manager</code> authorisation list is a naming ambiguity. It is not a claims manager operational report.
<code>recovery.case_summary</code>	Reports Centre only	Reports Centre — keep	Per-recovery-case report; better accessed from Recovery Portal
<code>executive.claims_trend</code>	Reports Centre only	Reports Centre — keep	Executive-level trend report; appropriate for Reports Centre
<code>executive.financial_exposure</code>	Reports Centre only	Reports Centre — keep	Executive-level financial report; appropriate for Reports Centre

Implementation Approach

The Review Queue tab should have a report dropdown button (similar to the existing `claim.assessment` button) that expands to show `claim.cost_comparison`, `claim.repair_decision`, `claim.audit_trail`, and `claim.forensic`. The dashboard header should have a “Portfolio Reports” dropdown alongside the existing `portfolio.claims_summary` button, containing `portfolio.dwell_time`, `portfolio.panel_beater_performance`, `portfolio.fraud_summary`, and `portfolio.assessor_performance`.

Deliverable 8 — Actionable Intelligence Assessment

Phase 8: Actionable Intelligence Assessment

The following table assesses each existing dashboard widget for its decision support and action-enabling capability.

Widget	Decision Supported	Action Available	Responsible Party	Workflow Triggered	Assessment
Total Savings KPI card	Financial performance awareness	None	Claims Manager	None	Information only — add trend arrow and link to <code>portfolio.claims_summary</code> report
Completed This Month KPI card	Throughput awareness	None	Claims Manager	None	Information only — add trend arrow vs. prior month
Total Claims KPI card	Portfolio size awareness	None	Claims Manager	None	Information only — add breakdown by status
Completion % KPI card	Throughput efficiency	None	Claims Manager	None	Information only — add trend arrow
Intake Queue tab	Assignment decisions	Assign to processor, assign to assessor, trigger AI, reset stuck	Claims Manager	Workflow transition to <code>under_assessment</code>	Actionable — well-designed
Review Queue tab	Approval/send-back decisions	Approve (close for processing), send back, add comment, generate report	Claims Manager	Workflow transition to <code>payment_authorized</code> or <code>internal_review</code>	Actionable — <code>closeForProcessing</code> bug remains
Active Claims tab	Portfolio monitoring	Send back (from active), add comment	Claims Manager	Limited	Partially actionable — no escalation action from this tab
Fraud Alerts tab	Fraud investigation oversight	View claim, add comment	Claims Manager	None	Partially actionable — no direct escalation to Fraud Manager
Processed Claims tab	Historical review	View claim	Claims Manager	None	Information only — appropriate for this tab
Fleet Approvals tab	Fleet account governance	Approve/reject fleet manager request	Claims Manager	Fleet account activation	Actionable — well-designed but not discoverable
Recovery KPI bar	Recovery oversight	Link to Recovery Portal	Claims Manager	None	Partially actionable — add direct link to recovery cases by status

Widgets That Provide Information Without Supporting Action

The four KPI cards (Total Savings, Completed This Month, Total Claims, Completion %) provide awareness but do not support any specific management action. They should be enhanced with trend indicators and drill-down links to the relevant tab or report. The Fraud Alerts tab allows viewing but does not provide a direct escalation path to the Fraud Manager — a “Refer to Fraud Manager” action should be added.

Deliverable 9 — Revised Claims Manager Report Specification

Phase 9: Claims Manager Monthly Report Redesign

The original audit proposed an 8-section report. This reconciliation retains all 8 sections and adds 4 additional sections that are directly relevant to claims operations management.

Report Title: KINGA Claims Operations Monthly Report

Audience: Head of Claims / Claims Manager

Frequency: Monthly (with on-demand generation)

Format: PDF, generated via `portfolio.claims_summary` report key

Section 1 — Executive Summary

A one-page overview of the month's key operational metrics, written as an AI-generated narrative using `invokeLLM`. Includes: total claims processed, total approved value, total savings identified, average processing time, fraud prevention rate, recovery rate, and a brief narrative on the month's key trends and anomalies. Data sources: `claims`, `ai_assessments`, `quotes`, `recovery_cases`.

Section 2 — Claims Throughput

Monthly intake vs. completion trend (bar chart), backlog trend (line chart), and completion rate vs. prior month. This section directly answers the throughput questions: how many claims entered, how many were completed, and what is the current backlog. Data sources: `analytics.getKPIs`, `analytics.getMonthComparison`.

Section 3 — Claims Ageing Analysis *(New — not in original audit)*

Count and value by ageing bucket (0–7, 8–14, 15–30, 30+ days) for all active claims. Horizontal bar chart with colour coding (green, amber, red, purple). Identifies SLA breach risk at the portfolio level. Data sources: `analytics.getClaimsAgeing`.

Section 4 — Workflow Bottleneck Analysis *(New — not in original audit)*

Per-stage claim count and average days in state, sorted by average days descending. Identifies which workflow stages are accumulating claims and where management intervention is required. Data sources: `analytics.getWorkflowBottlenecks`, `workflowAnalytics.getProcessingTimesByStage`.

Section 5 — SLA Performance *(New — not in original audit)*

SLA compliance percentage per workflow stage, with configurable SLA targets. Identifies which stages are consistently breaching SLA. Data sources: `workflowAnalytics.getSLACompliance`.

Section 6 — Financial Performance

Total reserves, total approved, total recovered, net exposure, leakage rate, and month-on-month comparison. Data sources: `analytics.getMonthComparison`, `analytics.getFinancialOverview`.

Section 7 — Fraud Intelligence

Flagged count, investigated count, confirmed fraud count, prevented loss value, and fraud investigation funnel (5-stage). Conversion rate (flagged → repudiated). Data sources: `analytics.getFraudInvestigationFunnel`, `claims.fraudRiskScore`.

Section 8 — Workforce Performance *(New — not in original audit)*

Assessor performance ranking (performance score, accuracy score, total assessments, avg completion time, tier). Processor productivity (claims handled, transition count). Identifies staff members requiring intervention. Data sources: `analytics.getAssessorPerformance`, `workflowAnalytics.getUserProductivity`.

Section 9 — Panel Beater Performance

Top panel beaters by volume, average quote variance vs. KINGA estimate, quality score, and average repair time. Identifies panel beaters generating excessive variance or delays. Data sources: `analytics.getPanelBeaterAnalytics`, `generatePanelBeaterPerformanceReport`.

Section 10 — Assessor Performance

Assessor ranking by performance score, average assessment accuracy vs. KINGA estimate, and tier distribution. Data sources: `analytics.getAssessorPerformance`, `generateAssessorPerformanceReport`.

Section 11 — Recovery Oversight

Recovery case count by status, total quantum, total recovered, recovery rate, approaching deadlines, and month-on-month recovery trend. Data sources: `trpc.recovery.getKPIs`.

Section 12 — AI Accuracy Audit

KINGA estimate vs. approved amount variance distribution, confidence score distribution, and fraud score accuracy. Data sources: `ai_assessments`, `claims.approvedAmount`.

Deliverable 10 — Reconciled Implementation Plan

Phase 10: Reconciled Implementation Plan

The following plan is structured by operational priority, not technical complexity. All items are grounded in existing backend capabilities — no new procedures need to be created for the High priority items.

Critical — Production Blockers

Item	Priority	Effort	Business Value	Justification
Fix <code>closeForProcessing</code> — replace <code>trpc.claims.approveClaim</code> with a dedicated <code>closeForProcessing</code> procedure that records the correct intent in the audit trail	Critical	1 day	Audit trail integrity; regulatory compliance	<code>ClaimsManagerDashboard.tsx:252</code> still calls <code>approveClaim</code> with <code>selectedQuoteId: 0</code> . This creates an ambiguous audit record that cannot be distinguished from a genuine approval. In a regulated environment, this is a compliance risk.

High — Operational Control Improvements

Item	Priority	Effort	Business Value	Justification
Add Claims Ageing panel above tab structure (consuming <code>analytics.getClaimsAgeing</code>)	High	0.5 day	SLA breach prevention; immediate ageing visibility	Procedure exists, returns 4-bucket data. Zero engineering risk. Claims Manager cannot currently answer “which claims are ageing?” without navigating to Active Claims and manually reviewing dates.
Add Escalation Alerts panel above tab structure (consuming <code>analytics.getCriticalAlerts</code>)	High	0.5 day	Immediate escalation visibility; high-value and high-fraud claim identification	Procedure exists, returns 4 alert categories. Claims Manager cannot currently identify high-value pending, high-fraud-risk, disputed, or stuck claims without navigating through multiple tabs.
Add Workflow Bottlenecks panel above tab structure (consuming <code>analytics.getWorkflowBottlenecks</code>)	High	0.5 day	Process improvement; bottleneck identification	Procedure exists, returns per-state count and avg/max days. Claims Manager cannot currently identify which workflow stages are accumulating claims.
Add Fraud Funnel panel to Fraud Alerts tab (consuming <code>analytics.getFraudInvestigationFunnel</code>)	High	0.5 day	Fraud oversight; conversion rate visibility	Procedure exists, returns 5-stage funnel with prevented loss. Claims Manager can see individual fraud-flagged claims but cannot see the portfolio-level fraud funnel.
Add per-claim report dropdown to Review Queue tab (<code>claim.cost_comparison</code> , <code>claim.repair_decision</code> , <code>claim.audit_trail</code> , <code>claim.forensic</code>)	High	1 day	Full report access within workflow	4 reports are authorised for <code>claims_manager</code> but have no UI entry point. Claims Manager must navigate to Reports Centre to access them.
Add Fleet Approvals to sidebar navigation	High	0.5 day	Feature discoverability	Fleet Approvals tab is fully functional but invisible from sidebar. New users will not discover it.
Add Portfolio Reports dropdown to dashboard header (<code>portfolio.dwell_time</code> , <code>portfolio.panel_beater_performance</code> , <code>portfolio.fraud_summary</code> , <code>portfolio.assessor_performance</code>)	High	1 day	Report discoverability	4 portfolio reports are authorised but have no entry point within the portal.

Medium — Management Intelligence Improvements

Item	Priority	Effort	Business Value	Justification
Add Workforce Intelligence panel to Intake Queue tab (consuming <code>analytics.getAssessorPerformance</code> + <code>workflowAnalytics.getUserProductivity</code>)	Medium	1 day	Informed assignment decisions; assessor management	Both procedures exist. Claims Manager currently assigns assessors without visibility of their current workload or performance.
Add SLA Breaches panel above tab structure (consuming <code>workflowAnalytics.getSLACompliance</code>)	Medium	1 day	SLA compliance management	Procedure exists with configurable SLA targets per stage. More granular than the Ageing panel.
Enhance recovery KPI bar — add total quantum, total recovered amount, and recovery-eligible claim count	Medium	0.5 day	Recovery financial visibility	<code>getKPIs</code> already returns <code>totalRecovered</code> and <code>totalSettlementAmount</code> . These are not currently displayed in the recovery bar.
Add Leakage Metrics panel (consuming <code>analytics.getMonthComparison</code>)	Medium	0.5 day	Financial leakage control	Procedure exists. Claims Manager cannot currently answer “is leakage increasing?”
Add count badges to Review Queue, Fraud Alerts, and Fleet Approvals tab labels	Medium	0.5 day	At-a-glance queue depth	Eliminates the need to click each tab to determine queue depth.
Add trend arrows to KPI cards (vs. prior month)	Medium	0.5 day	Throughput trend awareness	<code>analytics.getMonthComparison</code> returns prior-month data. Trend arrows would make the KPI cards actionable.

Low — UX and Convenience Enhancements

Item	Priority	Effort	Business Value	Justification
Add “Refer to Fraud Manager” action to Fraud Alerts tab	Low	1 day	Fraud escalation path	Currently no direct escalation path from Claims Manager to Fraud Manager.
Add structured <code>sendBackReason</code> field to send-back dialog (dropdown of predefined reasons)	Low	0.5 day	Audit quality; structured reason tracking	Currently free-text only. Structured reasons would enable reporting on send-back patterns.
Add Fleet Approvals count badge to sidebar	Low	0.5 day	Pending approval visibility	Eliminates the need to navigate to the Fleet Approvals tab to check for pending requests.
Add claim count badges to sidebar navigation items	Low	0.5 day	Queue depth visibility	At-a-glance queue depth from sidebar.
Add “Export to Excel” for Fraud Alerts tab	Low	0.5 day	Reporting convenience	Enables offline analysis of fraud-flagged claims.

Implementation Sequence Recommendation

The recommended implementation sequence is:

1. **Sprint 1 (Pre-Go-Live, 2 days):** Fix `closeForProcessing` + add Claims Ageing panel + add Escalation Alerts panel + add Fleet Approvals to sidebar. These four items address the only remaining production blocker and provide the minimum command centre visibility.

- 2. **Sprint 2 (Post-Launch Week 1, 3 days):** Add Workflow Bottlenecks panel + Fraud Funnel panel + per-claim report dropdown in Review Queue + Portfolio Reports dropdown in dashboard header. These items complete the intelligence layer and report accessibility.
- 3. **Sprint 3 (Post-Launch Week 2, 3 days):** Add Workforce Intelligence panel + SLA Breaches panel + enhance recovery KPI bar + add Leakage Metrics panel + count badges on tab labels. These items complete the management intelligence layer.
- 4. **Sprint 4 (Post-Launch Month 1, 2 days):** Low priority UX enhancements — structured send-back reasons, fraud escalation path, sidebar badges, Excel export.

Final Go-Live Readiness Assessment

Revised Readiness Scorecard

Dimension	v1.0 Score	v2.0 Score	Change	Notes
Navigation completeness	7/10	7/10	—	Fleet Approvals still not in sidebar
Data accuracy	8/10	8/10	—	Demo fallbacks remain correct pattern
Workflow completeness	5/10	7/10	+2	sendBackClaim resolved; closeForProcessing remains
AI intelligence utilisation	6/10	6/10	—	Portfolio AI still absent from Claims Manager Dashboard
Report coverage	4/10	4/10	—	8 of 10 authorised reports still have no direct UI entry point
Cross-portal integration	6/10	7/10	+1	Recovery KPI bar confirmed working; notification gaps remain
Audit trail quality	5/10	7/10	+2	sendBackClaim now records correct audit trail; closeForProcessing ambiguity remains
Command centre capability	3/10	3/10	—	No portfolio intelligence panels; no workforce visibility; no bottleneck identification
Overall	5.9/10	6.4/10	+0.5	Conditional — Operationally Viable with Intelligence Gaps

Revised Verdict

The portal is operationally viable for supervised claims operations. The sendBackClaim defect has been resolved, which removes the production blocker. However, the portal does not yet function as a Claims Operations Command Centre. A Claims Manager using this portal today can manage individual claims effectively but cannot answer the core portfolio management questions their role requires: which claims are ageing, where are the bottlenecks, which assessors are overloaded, and is fraud increasing or decreasing.

All the data needed to answer these questions exists in the backend. The gap is entirely in the frontend — the Claims Manager Dashboard makes zero calls to the analytics router, while the Executive Dashboard makes eight. Closing this gap is the highest-value engineering investment available for this portal.

Pre-Go-Live Checklist (Revised)

- ☐ Fix closeForProcessing — replace approveClaim with dedicated procedure (Critical — 1 day)
- ☐ Add Claims Ageing panel above tab structure (High — 0.5 day)
- ☐ Add Escalation Alerts panel above tab structure (High — 0.5 day)
- ☐ Add Fleet Approvals to sidebar navigation (High — 0.5 day)
- ☐ Verify all 6 DEMO_ fallbacks are not shown to live users (Medium — 0.5 day)

Total pre-go-live effort: 3 days

KINGA AutoVerify AI — Claims Manager Portal Reconciliation Audit v2.0

Produced using KINGA Claims Manager Reconciliation Audit Prompt v2.0

Audit scope: ClaimsManagerDashboard.tsx, server/routers.ts (claims.sendBackClaim, claims.approveClaim), server/routers/analytics.ts (getClaimsAgeing, getFraudInvestigationFunnel, getWorkflowBottlenecks, getCriticalAlerts, getAssessorPerformance, getPanelBeaterAnalytics, getMonthComparison), server/routers/workflow-analytics.ts (getSLACompliance, getUserProductivity), server/reporting/reportDefinitions.ts
